Data Analysis

Property and Housing Trends

Transportation and  
Housing Costs

Public Transportation  
Demand Forecasts

Tax Elasticity Analysis

Corporate and government entities often do not have the analytical capabilities to leverage one of their key assets: vast amounts of internal data. Econsult Solutions, Inc. possesses analytical insights that can provide organizations with valuable insights and help organizations improve many aspects of their operations.

Our team of 30 microeconomists has the internal resources and econometric skills to mine, process and analyze extremely large and complex sets of internal data, with millions of observations and variables.

Drawing on our advanced statistical databases and GIS software, our economists are able to uncover hidden patterns, unknown correlations, critical market trends, customer preferences and other useful business information. We have the tools to identify complex and subtle relationships within the data, handle computation of forecasts and counterfactuals and conduct hypothesis testing.

We are experienced in big data analytics and forecasting for public and private organizations. Our projects have run the gamut: state and nationwide home sales transactions and micro-data; block-level nationwide census data; as well as daily propriety sales and product shipment data.
